PLAN OF THE REPORT

I. Sources and Character of Lumber Prices:

1. Quotations from Trade Papers.
2. Quotations from Bureau of Labor Statistics and Federal Trade Commission.
3. The Forest Service f.o.b. Mill Prices.

II. Summary Tables and Charts:

1. Boston Market Prices.
2. Prices from Bureau of Labor Statistics and Federal Trade Commission.
3. Forest Service f.o.b. Mill Prices.

III. Factors Affecting the Price Fluctuations of Lumber:

1. The Major Swings of Lumber Prices 1873-1918.
2. The Yellow Pine Market Since 1914.
3. Special Factors Affecting the Prices of Other Kinds of Lumber.

IV. Exhibits of Lumber Prices:

1. Boston Market Prices.
2. Prices from Bureau of Labor Statistics and Federal Trade Commission.
3. Forest Service f.o.b. Mill Prices.

   1. Quotations from Trade Papers

   2. Quotations from Bureau of Labor Statistics and Federal Trade Commission.

   3. The Forest Service F.o.b. Mill Prices.

(W.I.B.-359-1)

Univ. of California

I. SOURCES AND CHARACTER OF LUMBER PRICES.

1. Quotations from the Trade Papers.

Quotations for many kinds of lumber are carried in the trade papers; but there is grave doubt as to the reliability of most of these figures.

An exhaustive study of lumber prices both in central markets and at mills over a period of years ending in 1910 was made a few years ago for the Bureau of Corportations by Messrs. David L. Wing and John M. Gries. After these men had obtained a large collection of prices from the books of saw mills and dealers, they compared their figures with the market quotations given in the trade papers. One of these papers, the COMMERCIAL BULLETIN of Boston, they found making reports that agreed closely with their own results. All the other trade papers were unreliable in varying degrees.

Accordingly, in the following bulletin no quotations from the trade papers are given excepting the somewhat limited range of figures for New England lumber carried by the above-named Boston Journal.

2. Quotations from the Bureau of Labor Statistics and the Federal Trade Commission

At our request, the Federal Trade Commission got one of their agents to collect a few quotations for the Price Section. We have also obtained two series from the Bureau of Labor Statistics; but for the reasons given above we have not used the quotations they accept from the New York LUMBER TRADE JOURNAL.

3. The Forest Service Prices.

Most of the material here presented comes from the Forest Service. Since the second quarter of 1913 this bureau has been obtaining reports of "average prices f.o.b. mill" on a great variety of lumber from mills scattered over the important producing sections. The averages are given as covering the three months preceding the date of each report. When substantially all the reports are in, the Forest Service compiles a separate mimeographed bulletin for each important type of lumber in each large producing area. In these bulletins each mill is represented by a number, so that the reports from a given enterprise can be followed. For example, there is a "Yellow Pine" bulletin, issued July 23, 1915, covering the states of Louisiana, Mississippi, Texas, Alabama, and Arkansas, carrying reports from 36 mills, and showing average prices during April, May, and June of 14 different grades of yellow pine, classified as (W.I.B.-359-2)

UNIV. OF
CALIFORNIA

flooring, finish, dimension stuff, timbers, common boards, car siding, car lining, lath, and mill run.

The Forest Service has furnished the Price Section with copies of all these bulletins. We have re-arranged the data to show prices for each grade of each kind of lumber at each mill in successive quarters. From the data thus arranged we have selected those series of prices which are most nearly complete for presentation in this bulletin.

Certain peculiarities of the data should be noted. (1) There is a considerable range in most cases between the prices reported by different mills even in the same state. The following is a typical example. In the above mentioned yellow pine bulletin, for the second quarter of 1915, the price of Flooring, No. 2, D. and M, 1" x 4" in Texas is reported by two mills at $8.00 per M feet; by one mill at $8.25; by three mills at $8.50; by one mill at $9.02; and by one mill at $10.00 (2) In few cases does the same mill present an unbroken record of prices for every quarter from 1913 to date. Average prices from the mills that do report on each date would be misleading, because the dropping out of a high-priced mill would frequently lower the average materially in a time when the remaining mills show no change in prices, or the dropping out of a low-priced mill would raise the average. It seems better to choose quotations from the one or two mills that report most regularly, and in case of breaks to supply a figure from some other mill, subtracting or adding the differential shown by prices in the preceding or following quarter -- unless, as often happens, there was no difference in prices. In other cases a mill which reported regularly in the earlier part of the period stops reporting altogether, or reports seldom, while another mill begins to report regularly. Then the two series of reports are spliced together with a differential or not, according as the prices reported in the overlapping reports agreed or differed. In a few cases a quotation is supplied by interpolating a price midway between the price reported by the mill in question in the preceding and in the following quarter. In all these cases specific explanations are made in foot-notes.

It is not contended that these Forest Service quotations are satisfactory in every respect. But their very irregularities probably reflect actual trade conditions. If prices in the central markets are substantially the same on a given grade of lumber, from whatever source it comes, the f.o.b. mill prices must vary with cost of shipping from each mill to that market. The irregularity of reports, again, arises in part from the cutting-off of timber from the region supplying a given mill. While central market reports are better tha these f.o.b. mill prices for certain purposes, tha latter have their own special significance. The precise methods of splicing series together and of supplying missing data from other mills, and of interpolating are matters of judgment and therefore open to question: but it is not probable that the difference between the figures arrived at by any two who edited the

Forest Service reports for publication would affect the general results appreciably. With all these shortcoming in mind, it still remains true that nowhere else can we find so large a body of authentic lumber quotations running back to pre-war days as in the Forest Service records.

II. Summary Tables and Charts:

1. Boston Market Prices

2. Prices from Bureau of Labor Statistics, and Federal Trade Commission

3. Forest Service f.o.b. Mill Prices.

II SUMMARY - Tables and Charts

The following tables and charts show for each kind of wood listed average relative prices (pre-war prices, July 1913 - June 1914=100). The materials from which the averages have been computed are given at length in Part IV. While the charts presented here are smaller in size than those given in the Book of Price Charts issued by this section, the scale to which they are drawn is the same as that used there.

1. Boston Market Prices

Source: The Commercial Bulletin, Boston.

Series included in each average of relative prices:

(A) Cypress; 6 series:

(a) No. 1 Shop, 1 inch
(b) No. 1 Shop, 2 inch
(c) No. 1 Shop, $1\frac{1}{4}$, $1\frac{1}{2}$ inch
(d) 1 s and 2 s; 1 inch
(e) 1 s and 2 s; 2 inch
(f) 1 s and 2 s; $1\frac{1}{4}$ and $1\frac{1}{2}$ inch

(B) Hemlock; 1 series:

(a) Boards, 10, 12, 14, 16 feet

(C) Pine, Arkansas and Long Leaf; 4 series:

(a) 1 x 4, Flooring Edge, Grain A
(b) 1 x 4, Flooring Edge, Grain B
(C) 1 x 4, Flooring Edge, Grain C
(D) 1/4 Partition B and better, 3/4 x $3\frac{1}{2}$

(D) Pine, North Carolina; 3 series:

(a) Edge, rough 4-4, under 12 inch
(b) Roofers, 6 inch
(c) Roofers, 8 inch

(E) Pine, Western White; 10 series:

(a) Fine Common 4-4
(b) No. 1 Cuts, 4-4
(c) No. 1 Cuts, 5-4
(d) No. 1 Cuts, 8-4
(e) Selects, $2\frac{1}{2}$ and 3 inch
(f) Selects, 4 inch
(g) Selects, 4-4,5-4,6-4,8-4.
(h) Uppers, $2\frac{1}{2}$ and 3 inch
(i) Uppers, 4 inch
(j) Uppers, 4-4, 5-4,6-4,8-4.

(F) Spruce; 17 series:

(a) Boards, Covered, 5 inch and up
(b) Boards, matched
(c) Bundled Furring, 2 inch

II SUMMARY - Tables and Charts (Continued)

(d) Clapboards, 4 feet, clears
(e) Clapboards, 4 feet, extras
(f) Frames, 8 inch and under
(g) Frames, 9 inch

(a) 1st and 2nds 4/4; 4 series
(b) No. 1 Common 4/4; 5 series
(c) No. 2 Common 4/4; 4 series
(d) No. 2 Common & better 4/4; 1 series

(B) Basswood; 3 series

(a) No. 2 Common 4/4
(b) No. 3 Common 4/4
(c) No. 2 Common and better 4/4

(C) Beech; 1 series

(a) No. 2 Common and better 4/4

(D) Birch; 4 series

(a) 1st and 2nds, 4/4
(b) No. 1 Common 4/4
(c) No. 2 Common 4/4
(d) No. 3 Common 4/4

(E) Chestnut; 10 series

(a) 1sts and 2nds 4/4; 2 series
(b) No. 1 Common 4/4; 3 series
(c) Sound, wormy 4/4; 4 series
(d) No. 3 Common 4/4; 1 series

(F) Cottonwood; 1 series

(a) 1sts and 2nds 4/4 6" to 12"

(G) Gum; 23 series

(a) 1sts and 2nds 4/4 red; 5 series
(b) No. 1 Common 4/4 red; 5 series
(c) 1sts and 2nds 4/4 saps; 5 series
(d) No. 1 Common 4/4; saps; 4 series
(e) No. 2 Common 4/4; 4 series

(H) Hard Maple; 3 series

(a) 1sts and 2nds 4/4
(b) No. 1 Common 4/4
(c) No. 3 Common 4/4

II SUMMARY - Tables and Charts (Continued)

(I) Hemlock; 17 series:

(a) No. 1 piece stuff S-1 S-1-E 2" x 4" - 16'; 5 series
(b) Boards No. 1 S-1-S, 1" x 8" - 16'; 3 series
(c) Timbers, Rough 4" x 4" to 8" x 8" - 16'; 3 series
(d) Fencing No. 1 S-1-S, 1" x 6"; 3 series
(e) Lath No. 1 3/8" x 4'; 3 series

(J) Hickory; 2 series:

(a) No. 1 Common 8/4 (b) No. 2 Common 8/4

(K) Oak (Plain); 31 series:

(a) 1sts and 2nds 4/4; 8 series (c) No. 2 Common 4/4; 8 series
(b) No. 1 Common 4/4; 9 series (d) No. 3 Common 4/4; 6 series

(L) Oak (Red Quartered); 3 series:

(a) 1sts and 2nds 4/4
(b) No. 1 Common 4/4
(c) No. 2 Common 4/4

(M) Oak (White Quartered); 14 series:

(a) 1sts and 2nds 4/4; 5 series
(b) No. 1 Common 4/4; 5 series
(c) No. 2 Common 4/4; 4 series

(N) Pine (North Carolina); 7 series:

(a) Flooring No. 2, 1" x 4" x 10' - 16'; 2 series
(b) Flooring No. 3, 1" x 4" x 10' - 16'; 1 series
(c) Roofers 1" x 8" D & M; 1 series
(d) Partition No. 1 13/16" x 3½", 10' - 16'; 1 series

III. Factors Affecting the Price Fluctuations of Lumber:

1. The Major Swings of Lumber Prices, 1873-1918

2. The Yellow Pine Market since 1914.

3. Special Factors Affecting the Prices of Other Kinds of Lumber.

HH/LGP Nov. 1, 1918.

III

FACTORS AFFECTING THE FLUCTUATIONS OF LUMBER PRICES.(1)

by

Homer Hoyt

Bureau of Research, War Trade Board.

---

1. The Major Swings of Lumber Prices, 1873-1918:

The period from 1873 to 1898 was characterized by relatively low lumber prices. The successive opening of new virgin forests prevented the rise in price which the rapid cutting of our timber would otherwise have occasioned. When the White Pine of the Lake States began to show signs of exhaustion, Southern Yellow Pine was ushered in as a general construction wood, and when the flood of Southern Yellow Pine reached its crest, the stands of Douglas Fir from the Pacific Coast tapped to supplant Yellow Pine in the markets of the West.

Between 1890 and 1907 lumber prices increased 94 percent while general prices advanced only 14.6 percent (2). Most of this increase took place between 1898 and 1907. Probably the chief reason for this rapid gain was the increasing distance between the timber stands and the large centers of population, thereby greatly increasing freight charges. Southern Yellow Pine is farther from the large cities and the centers of building activity than the White Pine of Michigan, and the Douglas Fir of the Pacific Coast must bear even a greater transportation charge than Southern Yellow Pine. Increased labor cost,

---

(1) The factors affecting lumber prices are very complex because of the number of species and grades of lumber, the great number of mills, and the wide territorial distribution of the lumber industry. The author does not pretend that this hastily written survey is an adequate or final summary of the situation. The conclusions in regard to the histories of particular species of lumber are to be regarded as only tentative. The discussion of the general factors affecting lumber prices was mainly derived from Mr. William B. Greeley's report - "Some Public and Economic Aspects of the Lumber Industry." Department of Agriculture, Report No. 114, 1917, but, as Mr. Greeley was not consulted in the preparation of this report, he is not accountable for any errors that may appear.

(2) Wilson Compton: "The Price Problem in the Lumber Industry," in The American Economic Review, September 1917. Vol. VII No. 3 Page 585.

which constitutes over half of the total cost of lumbering, and the high capitalization of timber stands based on the prospect of a growing scarcity of lumber - were also large factors in the abnormal increase in lumber prices. The cost of maintaining larger stocks of lumber on account of the increase number of species offered in the market, and the expense of bigger sales organizations to push competing species were minor causes of the upward trend.

The panic of 1907 had a most severe effect on lumber prices and the recovery of lumber prices after the panic was exceedingly slow. In fact, the history of lumber prices since 1907 has exhibited some new tendencies and has thrown some old tendencies into higher relief. Because of its more direct bearing on the subject of lumber price fluctuations during the war, this later period will be discussed in greater detail.

In general, lumber prices since 1907 have followed the main tendencies shown in the average fluctuations of "all commodities". This is to be expected in view of the influence exerted by the general state of business conditions upon building activities and upon many other industries which use lumber as a raw material. Thus, the building industries, which alone use over three-fourths of the lumber cut, expand when money can be borrowed at low rates, when business needs new factories, when favorable corps enable the farmer to make repairs and build new barns. On the other hand, new building is postponed or reduced to the minimum when the money market is tight, when business is dull and crops are bad. Similarly the railroads make more extensive purchases of lumber in periods of prosperity than in periods of depression; more furniture is bought when wages are high, and the demand for boxes increases in periods when a large volume of goods is being produced.

Notwithstanding the close relationship which exists between lumber and general commodity prices, it is a striking fact that since 1907, depressions in lumber prices are more marked than depressions in the prices of most other staples. The period of rising lumber prices begins later, is of shorter duration and does not reach the height attained by other prices. Moreover, lumber prices are affected adversely by local and minor causes which do not register any effect upon the price level of other commodities. This unfavorable position of lumber as contrasted with other staple commodities is generally admitted. (1) Its explanation is to be found in the fundamental

William B. Greely: "Some Public and Economic Aspects of the Lumber Industry". 1917 Department of Agriculture. Report No. 114.

economic characteristics of the lumber industries.

Lumber prices have lagged behind other prices because there is a strong pressure to increase lumber production even in the face of a declining and fluctuating demand.

The causes of the pressure to increase lumber production are: (1) Over-capitalization of timber stands on the basis of the high prices prevailing before 1907, and the accumulation of a vast timber surplus in the northwest by private owners, has resulted in a heavy burden of interest charges and taxes which accrue regardless of the rate of lumber production, and which make it desirable to keep on sawing lumber even when the demand is slack. Moreover, the present slow movement of investments in timber lands has forced timber owners to cut their lumber as the only means of liquidating their investment. Thus to reduce the load of fixed charges, and to withdraw excessive capital investments in timber lands, timber owners have been content to sell lumber on a falling market at a price that did not yield them a profit. (2) Because of the over-capitalization of lumber lands and bad accounting methods, lumber industries have had difficulty in securing credit at the banks and this has increased the pressure upon them to dump lumber on a falling market. Higher interest rates demanded by the banks from the lumber industry have also limited the amount of stock they could carry in dull times. (3) The perishable nature of lumber and its deterioration when stacked in yards prevent lumber from being held over long periods of depression. (4) The highly competitive nature of the lumber industry, due to the wide distribution of timber regions, the small capital necessary to start a saw mill resulting in the growth of over 40,000 mills, and the extreme individualism prevailing among lumbermen, have prevented the development of influences that might stabilize prices of lumber. In addition to the keen competition that prevails between different mills in the same region cutting the same species of wood, there is a continual struggle between the same species of wood cut in different regions and between different species of wood used for the same purpose. Thus Douglas Fir from the Pacific coast competes in the markets of the middle west with Southern Yellow Pine from the gulf states, North Carolina Pine, Eastern Hemlock, Western White Pine, and Western Yellow Pine. The possibility of substituting one species for another is constantly enlarging as new timber resources are tapped, methods for handling new timber resources are developed, and tastes for new woods are built up by advertising. This free competition between persons of all degrees of financial responsibility and accounting accuracy, between old regions striving to hold their supremacy against new regions seeking to overcome the disadvantage of distance by low mill prices, between new species striving to make inroads upon old species fortified by custom and tradition, has swept aside all tendencies to restrict lumber production or to maintain a price. The market has repeatedly broken under the attempts of small mills with slender financial backing to realize on their output at almost any price, or the attempts of large mills to liquidate excessive timber investments,

or the price-cutting of mills which did not know their costs. The diversity of conditions prevailing in the lumber industry, makes any co-operation difficult. (5) The lumber mills of the country could cut at least 50% more lumber than they have ever cut in a single year and this is a constant inducement to the mill owner to increase production and thus to reduce overhead expenses. (6) While the rapid reduction of timber resources in all parts of the country save the Pacific Northwest reduces the wide distribution of lumber and suggests the possibility of greater concentration of holdings in the future, there is no immediate probability of lessening the intensity of competition because the potential competition - (a) from new growth on the old forest lands of the East and South - (b) the imports of lumber from Canada and (c) the cutting of timber from the public forest lands under public regulation., (1/5 of all standing timber in the United States is still in public ownership) will hinder the development of any lumber trust. Thus present competition is not stayed by the prospect of a future combination.

During the very period when there was a great incentive to increase lumber production, the total demand for lumber was either stationary or declining. It is estimated that steel, concrete and cement have absorbed markets which formerly required one-fifth of the total lumber cut. (1) The increase of fire proof construction in cities has rapidly curtailed the use of lumber, and with the growth of the urban population the per capita consumption of lumber dwindles. Thus the per capita consumption of lumber in Montana in 1915 was 1,234 feet as compared with 293 feet for Pennsylvania and 206 feet for New York.(2) The per capita consumption of lumber in the United States has decreased from 485 feet in 1909 to 375 feet in 1915. Forest Service statistics indicate a decline in the total annual production of lumber, (which is roughly equivalent to annual consumption of lumber for building purposes) from 44,509,761,000 feet in 1909 to 39,807,251,000 in 1916 and 35,831,239,000 feet in 1917. While the Census of 1909 probably more nearly represents the total lumber production than the statistics of any other year, the suggestion of an absolute decline in lumber consumption is significant. (3)

While the demand for lumber is thus declining over a period of years, the demand for lumber also fluctuates from year to year and from season to season, causing alternate periods of overproduction and underproduction. Building operations may often be delayed and repairs can be postponed when conditions are unfavorable, so that expected markets do not always materialize and lumber that has been produced to meet an expected demand must often be dumped. Because of the enlarged mill

(3) Production of lumber, Lath and Shingles in 1916, by Franklin H. Smith, and Albert H. Pierson, April 19, 1918, U.S.Department of Agriculture, Bulletin 673 1917 Lumber Production (Mimeographed Copy) by Franklin H. Smith and Albert H. Pierson.

capacity, it is easier to increase than to curtail production and periods of overproduction thus last longer than periods of underproduction.

For the above reasons, lumber prices usually lag behind other prices in an upward price movement, are the first to feel the effects of depression and suffer more and longer than other prices.

In addition to these main influences affecting lumber prices there are a number of seasonal fluctuations. The price of building lumber is usually higher in the spring at the peak of building activity when shipments exceed production and stocks are running low. The state of building activity in part depends upon the general business conditions already referred to and in part upon the weather. A mild spring causes early building activity in the cities, but it stops building on the farms because of the opening of other farm work. The weather also affects production. Floods or a severe winter in the South hinder the production of logs and cause a shortage later in the year. These seasonal influences often blend in a larger movement, as when good weather brings good crops which lead to a return of prosperity, etc.

The actual fluctuations in lumber prices since 1907 shows the effect of the fundamental factors that have checked advances in lumber prices. It was not until 1912 that lumber prices had reached the level of 1907 and then because of the slight business depression in 1914 and 1915 prices again broke sharply. The general upward trend of prices which began as early as the fall of 1915, did not permanently influence lumber prices until the fall of 1916. The rise in lumber that has taken place since has been greatly stimulated by government orders and the enforced curtailment of production on account of the labor shortage. In spite of these aids, lumber prices have not risen quite so much as the average prices of "all commodities".

2. The Yellow Pine Market Since 1914.

Southern Yellow Pine is the leading species of American lumber; the wide distribution of its production, and the large extent to which it enters into building operations throughout the nation, cause its price to correspond to general influences affecting the prices of all commodities. Many of the forces controlling Yellow Pine prices have affected North Carolina Pine, and have had a strong sympathetic influence upon the prices of Douglas Fir, Hemlock, Western White Pine, and Western Yellow Pine, - the chief competitors of Southern Yellow Pine for general building purposes.

The general range of influences affecting all lumber used in building will accordingly be discussed in connection with Yellow Pine prices. In subsequent histories of the prices of other woods, only the special factors affecting these other woods will be discussed.

Yellow Pine prices reached a high level in 1912, and a general feeling of optimism caused an expansion of production and an increase in stocks. A tone of conservatism prevailing in most lines of business on account of the tariff and

pending currency legislation caused a pronounced decline in building activities and a fall in railroad purchases, which were immediately reflected in a sharp reduction of Yellow Pine prices. Under the stress of low prices many small Yellow Pine mills were shut down during 1913. The normal seasonal increase of building activities in the spring of 1914, checked the fall in prices for a time but this slight prosperity was short-lived. The curtailment of pine exports on account of the war increased to some extent the lumber to be absorbed in domestic markets, while the general depression in business caused by the outbreak of the European war stopped much of the fall building, and what was even more significant, the inability of the planters to market their cotton without a European outlet, almost completely cut off the demand for pine lumber in the agricultural regions of the South.

The effect of these forces was to force pine prices to still lower level until the end of 1914. While building permits issued during the first half of 1915,($371,867,000) were even lower than the preceding year, thus reflecting the adverse conditions of the fall of 1914, recovery was already in progress. Improvement of business conditions following the study of the effects of the European war, the financing of Southern cotton, the demand for lumber from factories with war orders, increased building activity; increase of orders from the railroads, large crops and high agricultural prices stimulating building on farms and settlement of the Chicago building strike, all increased the demand for lumber and started an era of rising prices by the end of 1915. Lumber prices lagged behind prices of other staple commodities, but when the advance in Yellow Pine prices started it was very rapid.

The accumulation of stocks, and increased production of Yellow Pine stimulated by rising prices, the difficulties in securing steel for building cars (affecting the demand for lumber used with steel), the shortage of export tonnage and the late development of building activity in the North caused a temporary set back in the price of yellow pine during the early part of 1916.

The rapid development of building to a new level of $463,735,000 in first half of 1916, some increased purchases of lumber by the railroads, and increased labor costs started Yellow Pine prices on an upward trend in the fall of 1916. The slump in prices in the early part of 1916, had caused curtailment of production and a reduction of stocks so that supplies were low, while fears of a car shortage and a general railroad strike checked the tendency toward over-production.

The demand for pine lumber kept increasing on account of good building conditions and eagerness of retail dealers to replenish their stocks whenever cars could be obtained. This demand was swelled by large government orders for cantonment stock and for wooden ships. While the demand for pine lumber was thus rising, the labor shortage was becoming more and more acute on account of the draft, so that a curtailment of Yellow Pine production was enforced. The result was that the Yellow Pine industry secured more orders than it could fill,and Yellow Pine prices kept advancing throughout 1917,until they have now reached a point that is slightly in advance of the average price of all commodities.
(W.I.B.-359-51)

The over production that has usually followed an era of high Yellow Pine prices has not taken place this year because of labor shortage. Lack of labor, and to a lesser extent the car shortage limits the production of Yellow Pine mills to from 50% to 70% of normal production, and the lumbermen are consequently able to sell this reduced output at high prices.

3. Special Factors Affecting the Prices of Other Kinds of Lumber:

(A) Ash:

Ash prices have been very stable during the periods of depression and have risen steadily since the beginning of 1917. The strong government demands for Ash handles, oars, and airplane parts and the relatively small and declining production of ash are sufficient to account for this rise in price.

(B) Basswood:

Basswood prices felt the full effects of the depression in 1914 and 1915, but a rise in Basswood prices commencing late in 1916 was reinforced early in 1918 by a strong government demand for Basswood for saddle stock and hydroplane bodies. The result of this increased demand for a wood that is produced in relatively small quantities was to force prices up during 1918 at a rate not exceeded by that of any other hardwood.

(C) Birch:

Birch, used chiefly for planing mill products, boxes and crates, furniture, chairs, woodenware, shuttles and fixtures fell to a very low price in 1915, but since than Birch prices have climbed steadily. Birch is used for training plane propellers, army vehicle stock and boxes, and such an advance in prices is to to expected.

(D) Chestnut:

Chestnut prices have corresponded very closely to the prices of Hard Maple, Ash, Poplar and Hemlock. While the Chestnut blight has increased Chestnut production temporarily, the effect of the reduction in Chestnut stands has probably offset the effect of a short-lived increase in Chestnut cutting.

(E) Cypress:

The significant feature to be noticed in Cypress prices, is the firmness they maintained during the period of depression in 1914. While prices of Yellow Pine declined sharply, Cypress prices were shaded only slightly.

Cypress prices have been maintained in the face of declining lumber market because of the special demand for the durable lumber Cypress for doors, sash, blinds, tanks, silos and because of the combination of circumstances

permitting a very effective degree of control over production. The concentration of the Cypress production in a few regions-chiefly in the swampy districts of Louisiana-the large investment required to build railroads and dig canals into the swamps, the necessity of carrying large stocks of Cypress because of the unusual period of time required to dry the green lumber, made necessary the investment of large capital and permitted a concentration of holding that is not possible in the case of other species of lumber. With a few large manufacturers controlling the greater part of Cypress production, with sales chiefly made through one selling agency, and with a production for which there is a special demand and which is durable and can be stored without considerable depreciation, Cypress producers were not under pressure to sell on a falling market. Consequently, when the demand for Cypress declines, the producers simply refuse to sell at any considerable reduction in price, curtailing their production to meet the reduced demand. Thus when demand for Cypress was only 70% of normal in November, 1913, the Lumber Trade Journal reports that "a majority of the manufacturers have announced their intention of adhering strictly to prices which they believe will yield a fair return on their product, and will make no further concessions regardless of the extent of the demand".

Prices thus being maintained at a relatively high level during periods of depression, the advance during periods of rising prices is not so marked.

(F) Douglas Fir:

Douglas Fir is the latest virgin forest wood to enter the market, and its stands are most abundant of any American wood.

Douglas Fir is used for general building on the Pacific coast, it is the chief wood exported to Chile and Peru, and it competes with Southern Yellow Pine in the markets of the Middle West. It is regarded as a substitute for Yellow Pine, and its production has increased to fill the vacuum caused by the slackening of pine production. Its price moves in sympathy with that of Southern Yellow Pine.

The price of Douglas Fir was unusually depressed during 1914, so that the Douglas Fir mills were losing money. Consequently a considerable rise in price was to be expected.

The marked rise that did take place probably exceeded expectations. This has been due to the strong government demand for Douglas Fir both for shipbuilding on the Pacific Coast and for airplane wings, to the continued exportation of Douglas Fir to Chile, Peru, etc., at almost a pre-war level, to the effective sales organization which has pushed Douglas Fir in the markets of the Middle West and to the rising of Southern Yellow Pine.

(G) Gum:

The advance in Gum prices since 1915 has exceeded the average increase in the price of other hardwoods. The reason for this exceptional advance is due to the rise of Gum from a cheap, little-known wood, to a wood which, as a result of advertising and a study of its qualities, is gaining increasing

favor for boxes and interior finish.

(H) Hemlock:

Hemlock lumber competes with Yellow Pine for construction work and its price moves somewhat in sympathy with Yellow Pine prices. Hemlock prices, however, have not risen as high as Yellow Pine prices during 1917. This is probably to be chiefly accounted for by the maintenance of Hemlock production during 1917 at practically the normal level on account of the demand for Hemlock bark for tanning.

(I) Hickory:

Hickory prices were fairly stable during the depression in 1914 and 1915, and since 1916 they have shown an advance equal to that of plain Oak. Hickory is chiefly used for vehicles and for handles and the increased war demand for both has enabled Hickory prices to keep pace with other hardwood prices.

(J) Maple:

Flooring is the most important use of Maple, although it is also employed extensively in furniture, chairs, vehicles and other wooden products. Maple has a variety of war uses which have strengthened the normal demand for Maple so that its increase in price has been equal to that of other hardwoods.

(K) Oak:

The price of plain Oak has fluctuated in the same general way as Yellow Pine prices. The demand for Oak is widely distributed among planing mills, car, furniture, vehicle manufacturers and a great variety of smaller consumers, and it consequently is controlled to a large extent by the fundamental price factors. The price of plain Oak during 1913 was higher than normal; with the result that its relative rise since 1913 has not been as great as that of Yellow Pine.

The market for white Oak is more specialized than the market for plain Oak, and its price fluctuations have been less pronounced.

The checkered price career of quartered red Oak may be due either to the narrow range of price quotations or to an unstable market due to fluctuating demand.

(L) North Carolina Pine:

North Carolina Pine followed somewhat closely the fluctuations of Southern Yellow Pine, until the spring of 1917 when its advance was checked.

A considerable amount of North Carolina Pine is used in box making. North Carolina Pine production has been particularly affected by labor shortage because of its proximity to many large government enterprises.

(M) Northern White Pine:

Northern White Pine prices have maintained almost an unbroken level even during periods of depression. This lumber, considered the best wood for doors, etc., is rapidly diminishing in supply and bears practically a monopoly price in its special field.

(N) Western White Pine:

Western White Pine prices, alone of all lumber prices, did not decline during 1914 and 1915, but maintained an unvarying level. This extraordinary stability is due to the same causes affecting the Northern White Pine, which the Western White Pine closely resembles.

These reasons are declining production and increasing demand for White Pine as a superior wood for doors, and planing mill products.

(O) Yellow Poplar:

Yellow Poplar prices declined only slightly during the depression in 1914 and 1915 and, during 1917 and 1918 they have risen rapidly.

The rising price of Poplar is to be expected in view of its diminishing rate of production, and the special demand for Poplar wood for high grade boxes on account of its odorless and easy-working qualities, and the demand for it for furniture panels and veneers on account of the clear, wide boards which can be sawed from Poplar logs.

The war requirements for Poplar for airplane construction contributed to the factors responsible for the rapid rise in price during 1917 and 1918.

(P) Spruce:

Spruce prices have exhibited very steady tendencies. The use of Spruce for both pulpwood and lumber has given it a great advantage. Being the chief pulpwood it has felt the stimulus of the rising cost of paper. As the best lumber for airplane propeller wings, its production has been pushed and its price advanced.

(Q) Hardwoods:

There is a sympathetic relation between the prices of various hardwoods because hardwoods usually occur in mixed stands, are produced jointly, and compete with each other for the same uses.

Hardwoods are the principal woods used by wide range of industries such as the furniture, vehicle, agricultural implement industries, and a multitude of other wood-using industries. Hardwoods are used in general construction much less than softwoods, being employed chiefly for interior finish and in expensive flooring. Because of the numerous industrial uses of hardwoods, however, their prices are affected by many of the fundamental forces which affect the building industry.

IV. EXHIBITS

1. Boston Market Prices.

2. Prices from the Bureau of Labor Statistics and The Federal Trade Commission

3. F.o.b. Mill Prices (Forest Service)

IV. Exhibits:

1. Boston Market Prices:

(a) Prices of Mill #701 Missouri substituted for Mill #205 Arkansas. This shift with a drop of 50¢ between the last quotation of the first and the first quotation of the second mill is perhaps justified by the fact that reporting prices on the two successive quarters shows no change in prices while the other will show a drop of $1.50.

(b) First quarter of 1913 not quoted. (b)(b) First two quarters of 1913 not quoted.

(c) Interpolated.
